Forget this software before getting it. I haven't changed it in 3 years and it doesn't work in Windows 7. Maybe there was a change in the build. It's a pain to get it working again. You must have the windows source code version to get it to work. The problem is that it will not work with the Enterprise version of windows. When you download the windows source code version of windows to be able to use the program, you will be unable to remove and add programs from the list. To fix that problem, download the latest windows version from Microsoft and install it. You will then be able to edit the system registry. It's a pain to get the sources code and have to do this every time I have to do a new project. I hope they do a new version that works with the windows 7 and 2008 enterprise edition. Advice for users: make sure you have the source code version of windows if you're going to use this program. Otherwise, you will be unable to get it to work. If you're going to be using the program for a long time, make sure you save a copy of the sources code for your original windows. Wish you would do this with any software. I will not buy this piece of junk any longer and I feel your pain. Why do you not get an open source version of your software? That would be nice. For example, you can use kodi media player without downloading and installing. You do not have to download the source code from the kodi site. Wish you would do this with any software.
