As of 2019, the latest release of AutoCAD is AutoCAD 2020. History Although the world's first commercially available CAD program was designed by MIT's Lincoln Laboratory in 1969, it was a line-drawing program based on a manual tracking system that had no numerical data in it. Towards the end of the 1970s, MIT researchers worked on an integrated graphics display system that could merge line-drawing and raster graphics together. This system, developed by Lincoln Laboratory, was the MIT Integrated Graphics System (MITS), and it was released in 1977. Autodesk's AutoCAD was released in December 1982 as a desktop app. The MITS system was more user-friendly than CAD programs of the day because it showed all of the data at once. It also was easier to make edits to the drawing and work with more information at once. MITS was an amazing product, but it required a graphics terminal and people could not move around the workstation easily. Lincoln Laboratory wanted to make a cheaper computer that could be more easily used by engineers in the field. They chose the LINC (Lincoln Institute for National Security Computer) 8K, a computer that could work with a regular 8" floppy disk drive. Lincoln Laboratory had the opportunity to show the LINC system to several potential customers, including the MITRE Corporation and Honeywell. The MITRE Corporation chose the MITS system and the Honeywell Corporation chose LINC. LINC was able to offer a larger screen and faster speed because the system only had three chips instead of eight. LINC was released in 1977 and could be purchased with either a 14" screen or a 19" screen. LINC also could take two disks instead of one, and it weighed less than a pound. LINC was not designed to be portable or work on networks, so that it would work in the field, but it had one major advantage: it was designed for engineers, not architects or draftsmen. The next step for Autodesk was to convince MITS's engineers to release a version of the system that could work with the programs they were already using. The MITS engineers, who were not the original designers of the system, agreed to release a single user version of MITS. Autodesk developed a new software package that integrated with MITS, and AutoCAD became the first integrated desktop CAD

REUTERS/Loren Elliott The U.S. Court of Appeals for the 9th Circuit dismissed an emergency motion by the American Civil Liberties Union, which said it was contesting a new rule that prohibits asylum seekers from being released from detention into the U.S. interior while their cases are being processed. The 9th Circuit said the motion was legally moot because a new rule had already been issued on Dec. 18. The new rule, published on Dec. 18, directs asylum officers not to grant a "credible fear"

interview to migrants who have violated the conditions of their release. The interview is one of the first steps in the asylum process. U.S. government officials had argued that the ACLU was wrong to bring the case because the deadline to file its appeal had already passed.

The Department of Homeland Security said in a statement the 9th Circuit's order could be appealed to the U.S. Supreme Court. "This order not only affects our nation's refugee admissions programs, it also undercuts our nation's security and our first-line defense against the world's most dangerous criminals," DHS said in a statement. A lawyer representing the plaintiffs in the case told Reuters it was "a big victory," but that it was important to continue the legal fight. "We are relieved that we will continue to pursue legal action on behalf of these families," ACLU staff attorney Lee Gelernt said a1d647c40b
