Attention deficit hyperactivity disorder (ADHD) is a neurobehavioral disorder of childhood that is characterized by symptoms including attention-deficit, impulsivity, and hyperactivity, and it typically persists into adulthood. There is substantial research documenting the lifetime prevalence of ADHD in adults; however, adult ADHD is often unrecognized and, if diagnosed, is frequently mischaracterized as accompanying comorbidity. For adults, the most common clinical presentations include middle-aged adults with adult ADHD with comorbid mood and anxiety disorders, older adults with ADHD and substance use disorders, and older adults with more subtle and cognitively based symptoms of ADHD, including attention- and executive-functioning deficits and sleep disorders.
