A: There is no step by step that we can give you on how to code something in R or in SPSS. It is essentially a trial and error process. It is something similar to programming in other languages but not exactly the same. You can open the R session by using Rgui or RStudio from a command line window. You can write a short R code using Rgui, which you can then transfer to a script in R. Alternatively, you can type that code in the R console window which is the "black box" where R executes. Programming is done in a very different way in R. The language is very powerful but its syntax is very different from regular programming languages. R provides a user friendly interface to it using the R-Console, RStudio and Rgui. Both R-Console and RStudio provide a workspace for your R-session. This workspace is just a set of windows that are opened when you use any of the above mentioned tools. I do not know how SPSS works. I am guessing SPSS is a statistical tool which can aid in the programming. There may be a way to simulate the R-console in SPSS but I am not aware of that. This is the answer to the question which is why we need to learn R to be able to code in R in SPSS. 1. Field of the Invention This invention relates to the wireless networking field and in particular to a method and system for adjusting an aging factor of a wireless communication system. 2. Description of the Related Art In a wireless communication system, a link

between a mobile station (MS) and a base station (BS) is called a serving link, and is characterized as an active link or an inactive link by the utilization of resources. A link between the MS and an access network is called a serving link, and is characterized as an active link or an inactive link by the utilization of resources. Depending on the scope of service covered by the access network, an inactive link means that the MS does not receive any data from the access network, but it is still allowed to request channels from the access network for service requests such as emergency calls, paging and tracking. As the MS moves, the serving link may be an active link or an inactive link. The active link means that the serving link provides service data to the MS. The inactive link means that the serving link does not provide service data to the MS
